

Practical 3 :- Monoalphabetic Cipher substitution cipher

```
#include<stdio.h>

#include<string.h>

char dc[26]="QWERTYUIOPASDFGHJKLZXCVBNM";
char ec[26]="abcdefghijklmnopqrstuvwxyz";

void e(char*);

void d(char*);

void main(){
    char *p;
    printf("\n\nEnter plain text:");
    scanf("%s",p);
    printf("\nAfter Encryption:\n---\n");
    e(p);
    printf("\n%s",p);
    printf("\nAfter Decryption:\n---\n");
    d(p);
    printf("\n%s",p);
}

void e(char *p){
    int l=0;
    while(*(p+l) != '\0'){
        *(p+l)=dc[*(p+l)-97];
```

```
        l++;  
    }  
}  
void d(char *p){  
    int l=0;  
    while(*(p+l) != '\0'){  
        int i;  
        for(i=0;i<26;i++) {  
            if(dc[i]==*(p+l))  
                break;  
        }  
        *(p+l)=ec[i];  
        l++;  
    }  
}
```
